

Plotting a straight line

- For any data plots such as on the previous slide, when we have one predictor (x) we could plot many straight lines.

$$y = \beta x_i + \beta_0 + \text{residual}_i$$

β = gradient of the line

β_0 = intercept (when $x=0$)

residual_i = difference between predicted score and actual score for participant i

Which line
seems the
best fit ?
