

- Git works by keeping track of changes you make to your script during each save - you can mark a point at which you want git to remember your script by ‘committing’ the script at the time point you save it...

- In this example, I've written two lines of code then saved my script - I then click "Commit" under Version Control in the Tools menu which then produces the following...

- We then need to put a tick on the box of what we want to commit and then write some sort of helpful message capturing the point in writing the script that we're making the commit.
