

# Similarities between t-tests and the ANOVA

- t-tests tell us whether or not two samples have the same mean.
- ANOVA tells us whether two or more samples have the same mean.
- As the t-test produced the t-statistic, the ANOVA gives us an F-statistic or F-ratio which compares the amount of systematic variance with the amount of unsystematic variance.

- ANOVA can tell us that there is a difference between means – so for three samples it tells us that  $\overline{X}_1 = \overline{X}_2 = \overline{X}_3$  is not true.
- But it doesn't tell us where the difference is.
- It doesn't tell us whether  $\overline{X}_1$  differs from both  $\overline{X}_2$  and  $\overline{X}_3$  or whether  $\overline{X}_2$  differs from  $\overline{X}_3$  but not  $\overline{X}_1$  etc.
