

- Then when you create a new project, tick the “Create a git repository” box

- Git works by keeping track of changes you make to your script during each save - you can mark a point at which you want git to remember your script by ‘committing’ the script at the time point you save it...

- In this example, I've written two lines of code then saved my script - I then click “Commit” under Version Control in the Tools menu which then produces the following...
