

- We can calculate the proportion of improvement in prediction by looking at the ratio of SS_M to SS_T .
- Actually, this is called R^2 so:

$$R^2 = \frac{SS_M}{SS_T}$$

And this is the same R^2 that we worked out by squaring the Pearson correlation coefficient.....

- We can also assess how good our model is by using the F-test.
- The F-test is based on the ratio of the improvement due to the model (SS_M) and the difference between the model and the observed data (SS_R).
- Rather than use the sums of squares themselves, we use the mean sums of squares (MS_M and MS_R).

$$F = \frac{MS_M}{MS_R}$$
