

# Plotting IQ against WM for our 10,000 participants

To avoid over-plotting, you can jitter the points and set them to be translucent via the alpha parameter.

```
> ggplot(data, aes(x = WM, y = IQ)) + geom_jitter(alpha = .1, position_jitter(0.5))
```

# With a regression line

```
> ggplot(data, aes(x = WM, y = IQ)) + geom_jitter(alpha = .1, position_jitter(0.5)) + geom_smooth(method = "lm")
```
