So, to make sense of our output

• We found a significant effect of Beverage type (F (2,42) = 297.05, p < .001, partial $\eta 2$ = .93). Bonferroni comparisons revealed that the Water group differed significantly worse than the Single Espresso Group (p < .001), that the Water group differed significantly worse the Double Espresso Group (p < .001), and that the Single Espresso Group permed significantly worse than the Double Espresso Group (p < .001).

 In other words, drinking a some coffee improves motor performance relative to drinking water, and drinking a lot of coffee improves motor performance even more.

ANOVA for factorial designs

- A particularly good package for factorial ANOVA is by Henrik Singmann and called afex.
- Built to work like ANOVA in SPSS uses Type III
 Sums of Squares with effect coding of contrasts.
 This overrides the default contrast coding in R
 which is for dummy coding.
